

# How to combine Android and Web page?

## Why

The general method to implement user interface in Android is to use XML. However, it can be complicated to use XML if you want to make a high-level user interface. It is much easier to use HTML to do UI.

Android has provided the interface.

*WebView.addJavascriptInterface(Object obj, String interfaceName)*

<https://developer.android.com/reference/android/webkit/WebView>

## Use Webview in Android

---

How:

create a webview in an android app and load the url using the webview. And many APIs have been already built in Android. To get more data, pls refer to <https://developer.android.com/reference/android/webkit/WebView>
